Prediction Project - Human Activity Recognition

Aixa Rodriguez Salan 15/July/2017

Introduction

Using devices such as Jawbone Up, Nike FuelBand, and Fitbit it is now possible to collect a large amount of data about personal activity relatively inexpensively. These type of devices are part of the quantified self movement - a group of enthusiasts who take measurements about themselves regularly to improve their health, to find patterns in their behavior, or because they are tech geeks. One thing that people regularly do is quantify how much of a particular activity they do, but they rarely quantify how well they do it. In this project, your goal will be to use data from accelerometers on the belt, forearm, arm, and dumbell of 6 participants. They were asked to perform barbell lifts correctly and incorrectly in 5 different ways. More information is available from the website here: http://groupware.les.inf.puc-rio.br/har (see the section on the Weight Lifting Exercise Dataset).

Data Source

The training data for this project are available here: https://d396qusza40orc.cloudfront.net/predmachlearn/pml-training.csv

The test data are available here: https://d396qusza40orc.cloudfront.net/predmachlearn/pml-testing.csv

The data for this project come from this source: http://groupware.les.inf.puc-rio.br/har. If you use the document you create for this class for any purpose please cite them as they have been very generous in allowing their data to be used for this kind of assignment.

```
## [1] 19622 160
dim(testing_data)
```

[1] 20 160

Firt set all the data with NULL values to NA and then remove all columns containing NA's and last remove some columns that are not related to dependant variables

```
training_data[training_data==""]<-"NA"
testing_data[testing_data==""]<-"NA"
training_data<-training_data[,colSums(is.na(training_data))==0]</pre>
testing_data<-testing_data[,colSums(is.na(testing_data))==0]</pre>
col_del<-c('X', 'user_name', 'raw_timestamp_part_1', 'raw_timestamp_part_2',</pre>
            'cvtd timestamp', 'new window', 'num window')
training_data<-training_data[,-which(names(training_data) %in% col_del)]</pre>
testing_data<-testing_data[,-which(names(testing_data) %in% col_del)]
dim(training_data)
## [1] 19622
dim(testing_data)
## [1] 20 53
And last split training_data into a 60% training and 40% testing data set used to make the cross validation.
set.seed(9910)
inTrain<-createDataPartition(training_data$classe,p=0.6,list=FALSE)
dt_training<-training_data[inTrain,]</pre>
dt_testing<-training_data[-inTrain,]</pre>
dim(dt_training)
## [1] 11776
dim(dt_testing)
## [1] 7846
               53
```

Prediction Algorithms

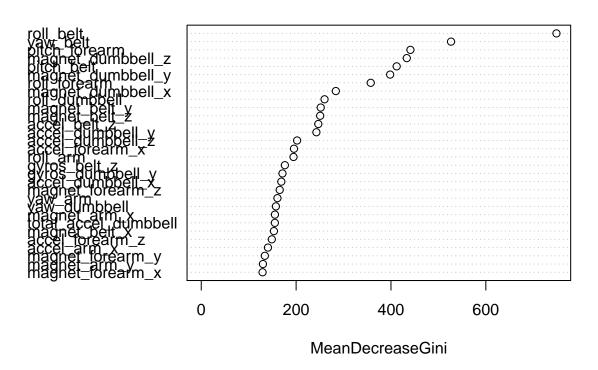

Now we are trying to predict the model

Random Forest (rf)

```
mod_rf<-randomForest(classe~.,data=dt_training,ntree=500)</pre>
print(mod_rf)
##
    randomForest(formula = classe ~ ., data = dt_training, ntree = 500)
##
                  Type of random forest: classification
##
                        Number of trees: 500
##
## No. of variables tried at each split: 7
##
##
           OOB estimate of error rate: 0.62%
## Confusion matrix:

                                                   0.8301
                                                            0.7747
```

Support Vector Machines (svm)

```
mod_svm<-svm(classe~.,data=dt_training)</pre>
print(mod_svm)
##
## Call:
## svm(formula = classe ~ ., data = dt_training)
##
##
## Parameters:
##
      SVM-Type: C-classification
##
   SVM-Kernel: radial
##
          cost: 1
         gamma: 0.01923077
##
##
## Number of Support Vectors: 5754
pred svm<-predict(mod svm,newdata=dt testing)</pre>
confusionMatrix(pred_svm,dt_testing$classe)$overall[4]
## AccuracyUpper
```

As we can see using differents algorithms to predict and comparing the accuracy of each one Random Forest it's the most accuracy with a 99%.

	Accuracy	Kappa	AccuracyLower	AccuracyUpper
Random Forest	0.9933724	0.9916168	0.9913178	0.9950464
Cran RPart	0.5686974	0.4581549	0.5576512	0.5796925
LDA	0.7012490	0.6219291	0.6909841	0.7113643
SVM	0.9440479	0.9291198	0.9387315	0.9490314

Predicts on Testing Set

0.9490314

##

Now using Random Forest to predict the outcome of the testing set

```
pred_testing<-predict(mod_rf,testing_data,type="class")
print(pred_testing)</pre>
```

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20
